

Project Proposal

Project Topic: IT Chatbot Powered by AI

Team Members:

- Burak Berk Yilmaz
- Sahra Naz Tok

Project Description:

Introduction

In today's digital era, artificial intelligence (AI) has become an integral part of various applications, enhancing user experience and automating processes. Our project, the "IT Chatbot Powered by AI," aims to provide an intelligent chatbot designed to assist users in resolving IT-related issues and inquiries. This chatbot will be a desktop-based application, built using Python, and integrated with an AI-powered API to ensure accurate and context-aware responses.

Features and Functionalities

The IT Chatbot will include several core functionalities to enhance its usability and effectiveness:

1. AI-Powered Responses

The chatbot will utilize an AI API to provide meaningful, relevant, and context-aware responses to user queries. It will be capable of handling various IT-related topics such as troubleshooting software issues, providing technical documentation, and answering frequently asked questions.

2. User Authentication and Session Management

The application will feature a login screen to authenticate users. Additionally, it will remember previous conversations and load them upon login, allowing users to maintain continuity in their interactions.

3. Desktop Application with Setup and Executable File

The chatbot will be developed as a desktop application with a dedicated setup file. This setup will ensure smooth installation, and the application will be executable without requiring users to run

scripts manually.

4. Secure API Key Management with Backend Proxy

Instead of embedding the API key in the application, a backend server will act as a proxy between the chatbot and the AI API. This approach prevents users from directly accessing the API key, enhancing security and allowing better control over API usage. The chatbot will send requests to the backend, which will then forward them to the AI API and return the responses securely.

Implementation and Technologies

- Programming Language: Python
- AI Integration: AI API for natural language processing and response generation
- User Interface: PySide6 (Qt for Python) or Electron with React for a modern, sleek, and responsive design
- Database Management: SQLite or a lightweight database for storing user sessions
- Security Measures: Backend proxy to handle API requests securely

Expected Outcomes

By implementing the IT Chatbot, we aim to provide a user-friendly, intelligent assistant capable of streamlining IT support. Users will benefit from an AI-powered system that offers quick responses, remembers past conversations, and ensures a seamless experience through a dedicated desktop application.

This project will serve as a demonstration of AI's practical applications in IT support while also enhancing our technical skills in software development, API integration, and cybersecurity.

Conclusion

The "IT Chatbot Powered by AI" is a step toward making IT assistance more accessible and efficient. By leveraging AI-driven responses and user session management, our chatbot will provide an interactive, responsive, and secure experience. We look forward to developing this innovative solution and enhancing its capabilities over time.
